

The data are from the study that was reported at the Biomonitoring Symposium last February, resulting in a publication. We did a 1676 on that package and you should have a record of it. The data are anonymified and cannot be traced to the original human subjects. The data represent basic scientific research results, which we have already published and released.

Scientists who wish to confirm the methods we published or test alternative methods may request the data and download them for such testing. In particular, Dr. Raquel Prado of UC Santa Cruz, who consults with us on the ERTAS project will download the data to test additional hypotheses and develop models not required for the ERTAS project. She may do this cooperatively with her students and post-docs. Other than this pending request, we have not yet promoted the data in any manner, but I recommend a web-based release to allow us to honor future requests. For example, we expect to collaborate with Dr. Kevin Knuth at SUNY Albany, with whom I expect to co-author a paper on multi-state modeling of cognitive fatigue using these data.
